## Assignment No-1

- 1) Explain the following terms with example
- |                      |                              |
|----------------------|------------------------------|
| a) Isomers           | f) Chiral compound           |
| b) Structural isomer | g) achiral compound          |
| c) Stereoisomers     | h) diastereomers             |
| d) Optical isomer    | i) Meso compounds.           |
| e) Enantiomer        | j) optically active compound |

### a) Isomers

Isomers are different compounds having the same molecular formula but different physical & chemical properties.

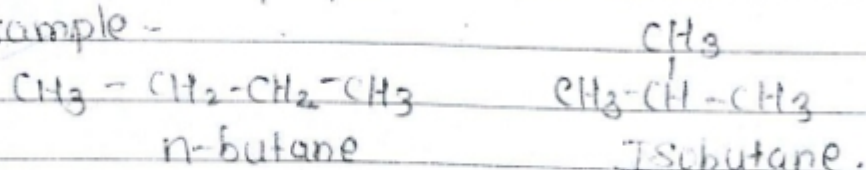

for example

### b) Structural Isomers :

Structural isomers have same molecular formula but different structure and therefore have different properties.

for example -

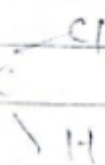

### c) Stereoisomers :

Stereoisomers have same molecular & structural formula same bonding sequence but differ only in way the atoms are oriented in space.

for example

d) Optical Isomerism:

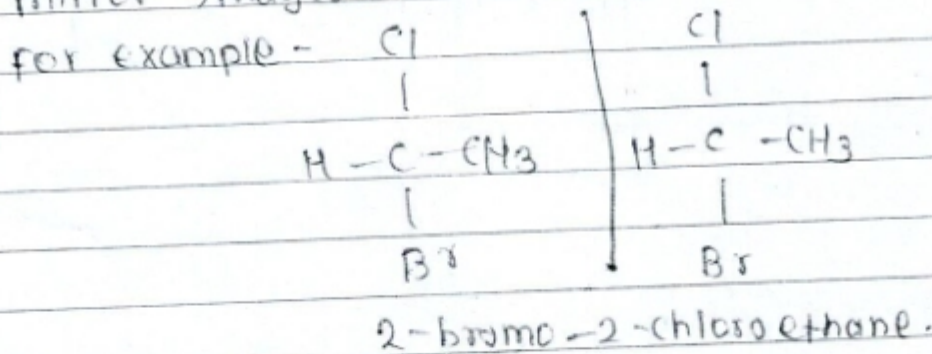

An optically active compound exist in two isomerism form which rotate the plane polarized light in opposite direction.

For example -

e) Enantiomers:

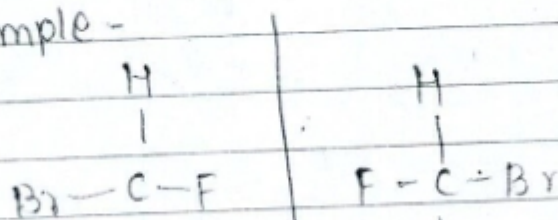

Two compounds that are non-superimposable mirror images of each other

f) Chiral compound:

A mol. / object that is not superimposable on its mirror images is said to be chiral.

for example -

g) Achiral molecule:

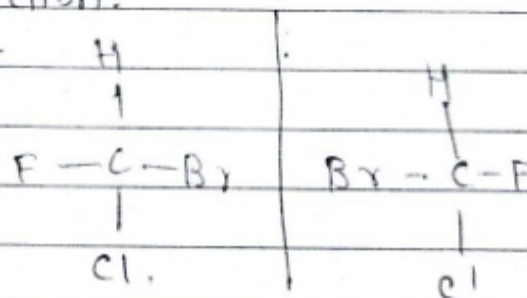

A mol. object that is superimposable on its mirror images is said to be achiral compound.  
For example -

h) optically active compound:

An optically active compound exist in isomers forms which rotate plane polarized light in opposite direction.

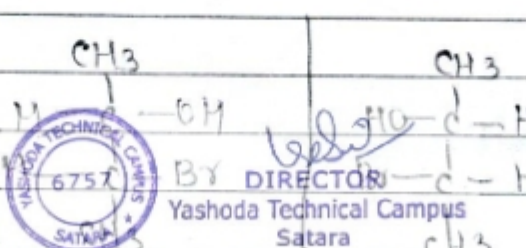

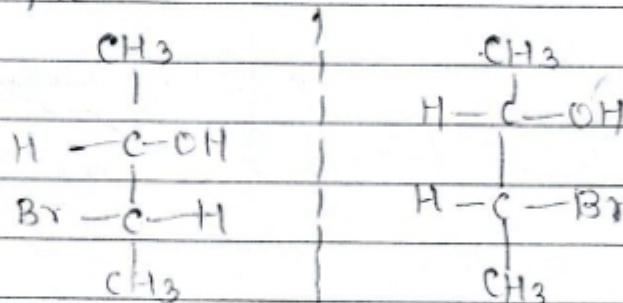

For example -

i) Distereomers:

Two distereomers that are not mirror images of each other.

For example -

BY DIRECTOR  
Yashoda Technical Campus  
Satara

j) meso-compound :

A compound having more than 2 chiral carbon atoms but also plane of symmetry are called meso compounds.

For example :

2,3-dihydroxybutane.

2) Explain the concept of optically activity.

→ Rotate the plane of polarized light towards right / left to some extent & this phenomenon is called optical activity.

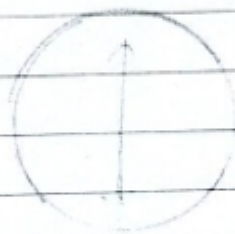

- The chemical and physical properties of the enantiomers are identical except in their interaction with their chiral substance & plane polarized light.

Plane polarised light : A beam of light which has vibration only one plane is called as plane polarised light.

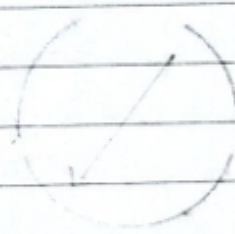

- The wave vibrations are particular to directions of travel of the wave.

Normal light

Plane polarised light

Plane polarised light.

← Involve both electric & magnetic force

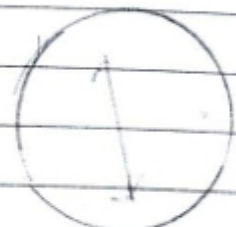

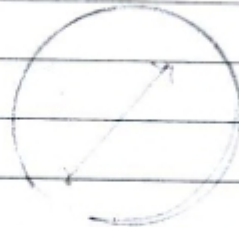

*Yashoda*  
DIRECTOR  
Yashoda Technical Campus  
Satara

- optical isomers rotate the plane polarised light.

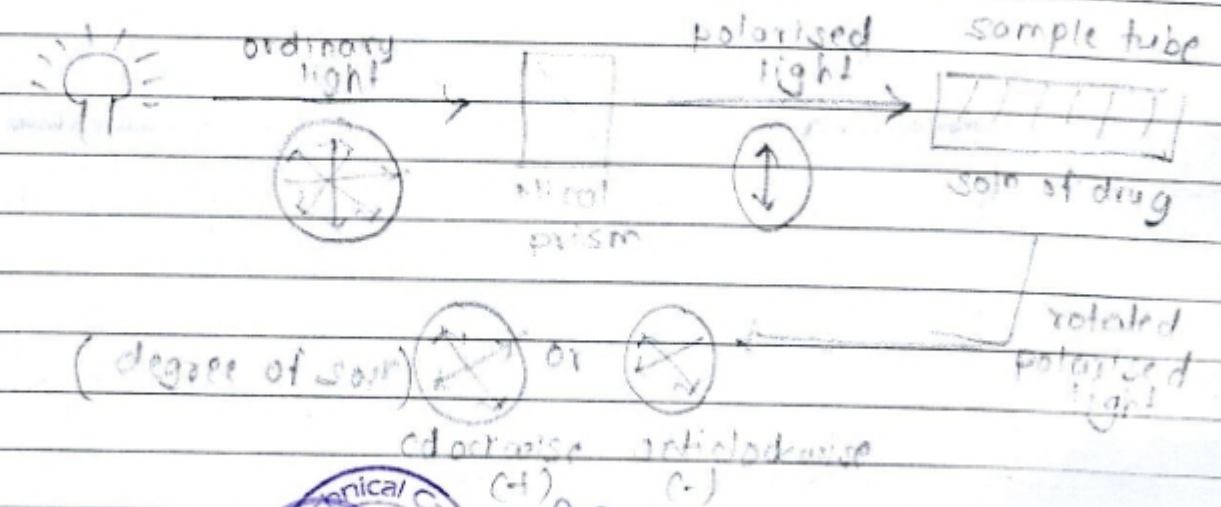

Enantiomer (+)  
(anti-clockwise  
rotation)

Enantiomer (+)  
(clockwise  
rotation)

Enantiomer (-)  
(no overall  
effect).

Plane polarised light arises from passing ordinary light through a polariser which is made up of calcite and Iceland spar. Today, polarimeter used a polarised lense similar to that of used in some sunglasses.

- A polarimeter is instrument that allows the polarised light to travel through sample tube containing an organic comp. and permits measurement of degree to which light is rotated.

DIRECTOR  
Yashoda Technical Campus  
Satara

## Specific rotation ( $\alpha$ )

Specific rotation produced by sol<sup>n</sup> of length 10cm and unit concentration (gm or per m) for given wavelength of light at given temperature.

$$\text{Specific rotation } (\alpha) = \frac{\alpha}{l \times c}$$

$\alpha$  = observed rotation

$l$  = length of sample tube.

$c$  = concentration

- The rotation of polarised light can be clockwise or anticlockwise.
- If the isomer rotate of plane polarised light to the right hand side i.e clockwise direction known (+) isomer.
- If the isomer rotate the plane polarised light to the left i.e anticlockwise is known as (-) isomer.

## Assignment - 2

1) What is Geometrical isomerism? Give reason and Conditions of Geometric Isomerism.

→ i) Is a general phenomenon and is shown by any molecule which can assumed rigid configuration due to hindered rotation in a portion of the molecule

ii) This isomerism is mostly shown by such compounds which contain atleast one C=C and in which each of the doubly bonded carbon atoms have same or different sets of two unlike atoms or groups

iii) Isomers each have same molecular formula and structural formula but differ in relative spatial arrangement. of atoms or group of atoms above the double bond are called geometrical isomers. and the phenomenon is known as geometrical isomerism.

mallic acid

⊗ fumaric acid.

Reasons of Geometrical isomerism :-

i) The C=C double bond consist of one sigma and one π bond, The π bond is formed by side wise overlapping of unhybridized p-orbitals of two carbon atoms above and below plane of the bond. because of overlapping a rotation around is strongly hindered.

DIRECTOR  
Yashoda Technical Campus  
Satara

ii) IF the doubly bonded carbon atoms are rotated with respect to each other sidewise overlapping of p-orbitals will not be possible and therefore  $\pi$  bond will be cleaved.

Hundred rotations of carbon atoms above double bond is essential cause for geometrical isomerism.

iii) Due to hindered rotation around  $C=C$ , the relative positions of atoms or groups attached to doubly bonded carbon atom get fixed in space giving rise to distinct isomeric form

Conditions For Geometrical Isomerism:-

i) Presence of atleast one double bond.

ii) Each carbon atoms of double bond should be linked to two different atoms or groups.

2) Explain in detail methods of determination of configuration of geometrical isomerism.

→ I] Melting Point:-

The trans isomer is having higher melting point than the corresponding cis isomer, this is due to fact that in cis isomers two similar atoms are on same side of double bond.

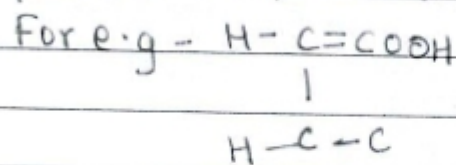

Therefore, these molecules are unsymmetrical hence, do not show closed packing in crystal lattice. on the other hand trans isomer is more symmetrical because two similar atoms or groups lie on opposite side hence, they

DIRECTOR  
Yashoda Technical Campus  
Satara

packed well in crystal lattice.

m.p. = 130°C mallic acid

fumaric acid

melting point 302°C.

II] Solubility :-

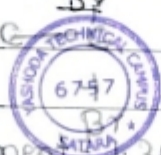

- i) It depends on intermolecular forces, cis isomer having weak intermolecular forces of attraction in crystal lattice than corresponding trans isomer.
- ii) Due to this cis isomer have high solubility than trans isomers.

For e.g. - mallic acid having 79 gm per 100ml solubility in water at 20°C whereas, fumaric acid having 0.7 gm per 100ml solubility in water at 20°C.

III] Dipole moment :-

- i) It has been found that cis isomer have higher dipole moment as compared to trans isomer which have zero or nearly zero dipole moment because, two dipoles are cis isomer oriented at same angle whereas, two dipoles trans isomer are oriented opposite angle where therefore, they cancel out.
- ii) But trans isomer we have zero dipole.
- iii) It is an important physical property which helps in establishing configuration geometrical isomerism.

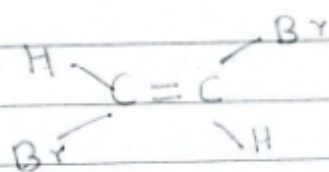

for e.g. -

$\begin{array}{c} \text{Br} \\ | \\ \text{C} - \text{C} - \text{H} \\ | \\ \text{Br} \end{array}$   
DIRECTOR  
Yashoda Technical Campus  
Satara

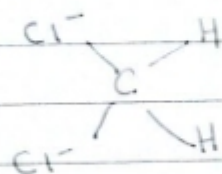

Dipole moment 1.35D cis 1,2-dibromoethane

trans-1,2-dibromoethane

Dipole moment = 0 D

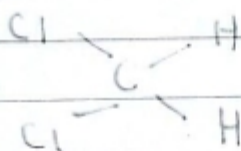

Dipole moment = 1.85 D

#### IV] Boiling point

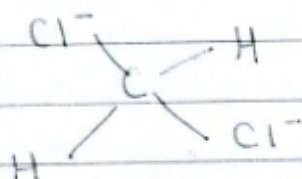

i) cis isomer having higher boiling point than trans isomer this is due to higher dipole moment !

ii) for e.g. -

cis-1,2-dichloromethane

Boiling point = 60°C.

trans-1,2-dibromochloromethane.

### Assignment No-3

1) Describe in detail structure of pyrrole, furan and thiophene.

#### 2 Structure of pyrrole

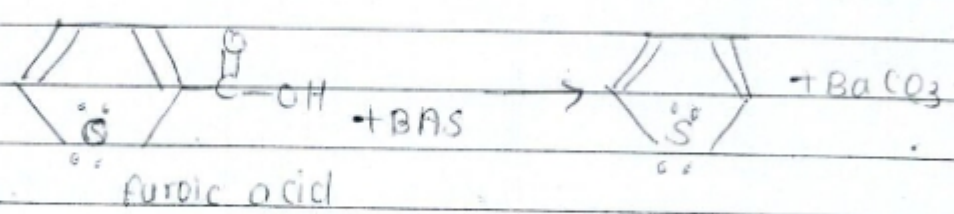

- In pyrrole, the nitrogen atom and four carbon atoms are  $sp^2$  hybridized.
- The  $sp^2$  hybrid orbitals overlap with each other and with s orbitals of the five hydrogen atoms forming C-H, C-C, C-N, N-H  $\sigma$  bond. All these bonds are lie in one plane.
- Also each carbon atom and nitrogen atom are unhybridized p atomic orbital and perpendicular to plane of  $\sigma$  bond.
- The p orbitals on carbon contain one electron and on nitrogen contain two electrons.
- The lateral overlap of p orbitals produces  $\pi$  molecular orbitals containing six electrons. an arrangement that is commonly called aromatic sextet.
- Pyrrole shows aromatic properties or aromaticity because  $\pi$  molecular orbital satisfies Huckels rule.

- The common short-hand representation of pyrrole is simply pentagon, five membered ring with a circle inside

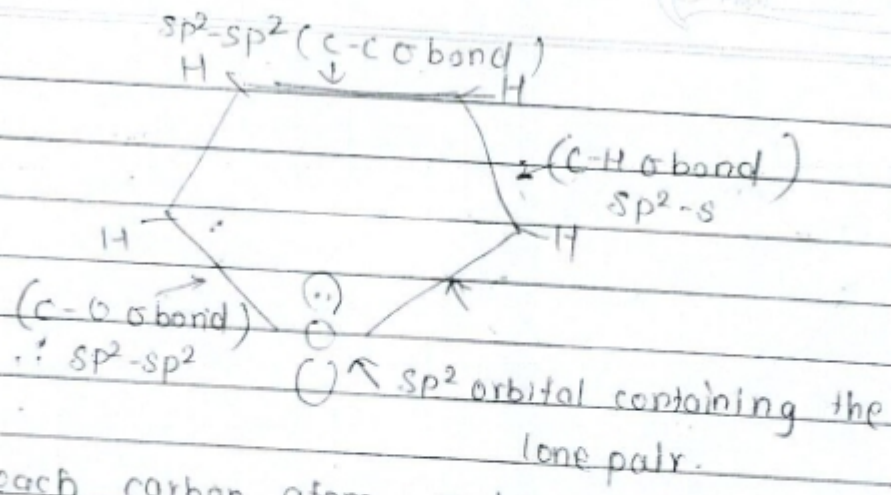

According to this resonance theory, pyrrole is considered to be hybrid of following

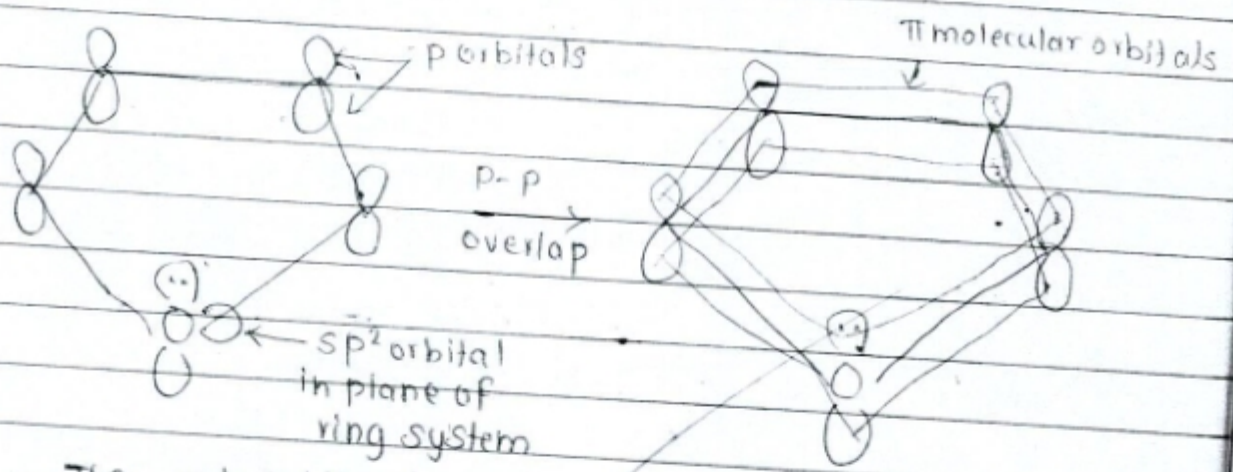

Structure of furan :-

- In furan, the oxygen and four carbon atoms are  $sp^2$  hybridized.
- The  $sp^2$  hybrid orbitals overlap with each other and with s atomic orbitals forming C-C, C-H, C-O, O-H  $\sigma$  bonds. All the  $\sigma$  bonds lie in one plane.

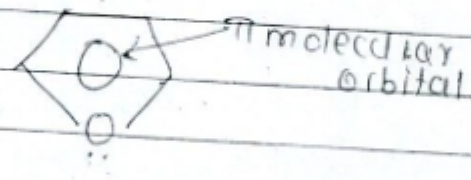

- Also each carbon atom and oxygen atom possess unhybridized p orbital and these are perpendicular to the plane containing  $\sigma$  bonds.
- The p orbitals on carbon contain one electron each and p orbitals on oxygen contain an unshared pair of electrons.

The unhybridized p  $\pi$  orbitals in furan overlap with each other to form delocalized  $\pi$  molecular orbital above and below the plane containing  $\sigma$  bonds.

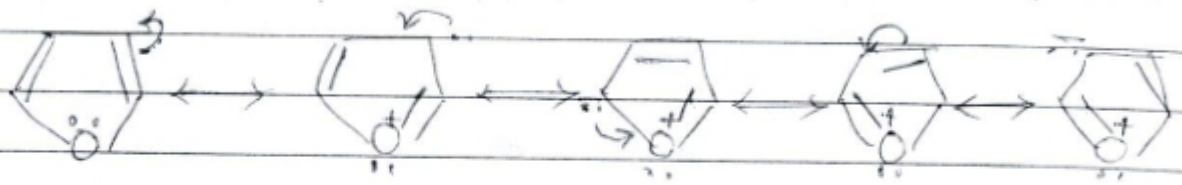

According to resonance theory, furan is considered to be hybrid -

## Assignment Experiment No-4

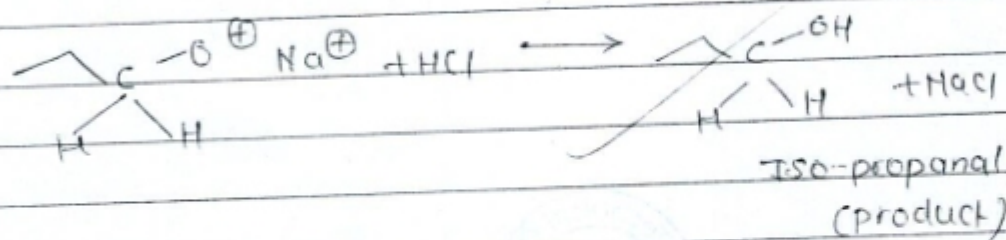

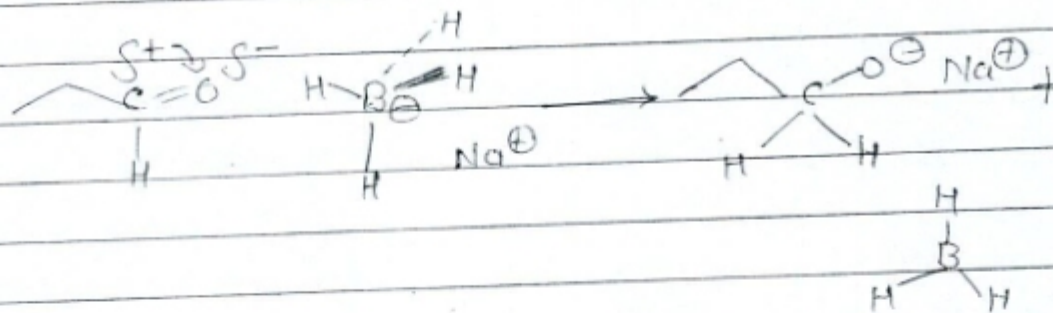

1) What is reduction rxn? Explain the mechanism of metal hydride reaction with example.

→ Reduction is the loss of oxygen atom from a molecule or the gaining of one or more electrons. A reduction rxn is seen from the point of view of the molecule being reduced as when one molecule gets reduced another gets oxidised. The full rxn is known as Redox rxn.

Mechanism of metal hydride Reduction.

1)  $\text{NaBH}_4$  rxn (for aldehyde)

eg - mechanism of rxn betw propanal and  $\text{NaBH}_4$

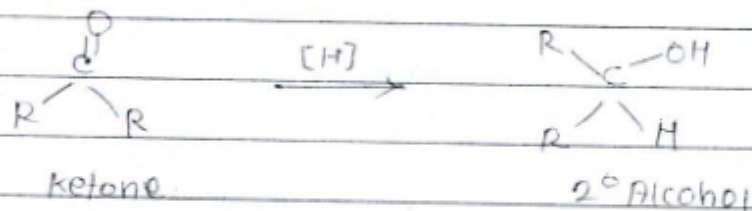

2)  $\text{LiAlH}_4$  Reduction (for ketone)

Mechanism can be explained by simple reaq<sup>n</sup>

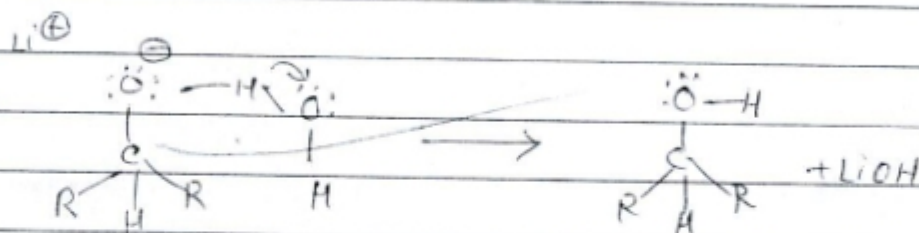

It includes 2 steps

Step-I :- Nucleophile attack by the hydride anion

Step-II :- The alkoxide is protonated,

Protonated alkoxide gives alcohol.

### Assignment No-5

- Write a note on basicity of pyridine.
- Pyridine is a 6-membered heterocyclic (N-containing) comp.
- Pyridine is a basic in nature  $pK_a = 8.75$ . It react with strong acids to form salts.

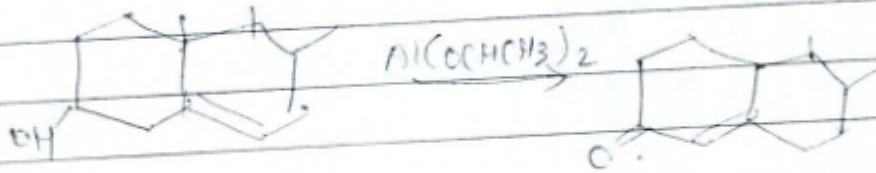

Explanation -  
 let us consider the structure of pyridine, pyrrole and aliphatic amines.

- The main reason for the basic character of the pyridine is that of nitrogen lone pair electrons in  $sp^2$  hybrid orbitals and are not involved in the formation of delocalised  $\pi$ -molecular orbitals.

### Open Book Test - I

- 17 Write note on R and S configuration.
- Stereoisomers are different compounds and often have different properties.
- Each stereoisomer must have a unique name.
  - The system that we use was devised by R.S. Cahn Sir Christopher Ingold and Vladimir Prelog.
  - R and S is used to describe absolute configuration.
  - It is dependent on the sequence rule which is established to group polarities.

#### Rule-1

Each atom bonded to a chiral carbon is assigned a priority and this priority is based on the atomic number.

- Higher the atomic no., higher the priority.

#### Rule 2

If the priority cannot be assigned on the basis of atomic number, then atomic mass is considered. For isotopes, the higher the atomic mass, the higher the priority.

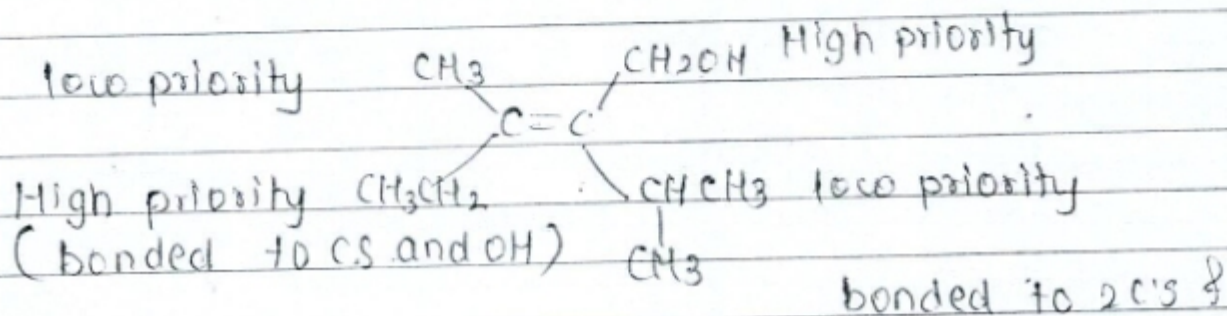

### Rule 3:

If priority cannot be assigned on the basis of atomic no. and atomic mass consider atom of a group.

Priority is assigned/decided by a comparison with first point difference.

For example

(bonded to 3 'H's) (bonded to O & 2 'H's)

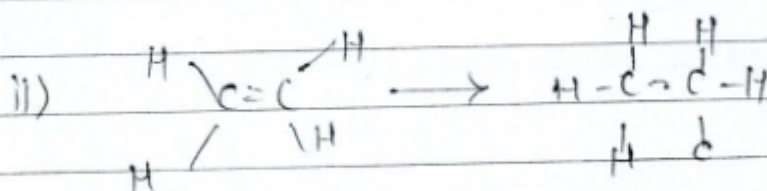

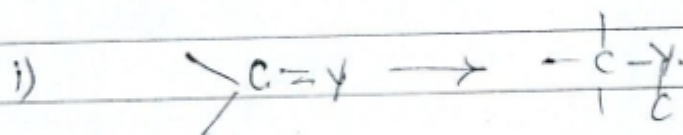

2-isopropyl-3-methyl-2-pentane-1-ol. one H

### Rule 4:

In this case of double or triple point bond particle (parting double triple bond similar atom by single bond i.e. atoms of double triple bond are replicated

Q7 Write a note on elements of symmetry.  
→ Those compounds which can be divided into two equal parts form axis plane called 'symmetrical compound'.

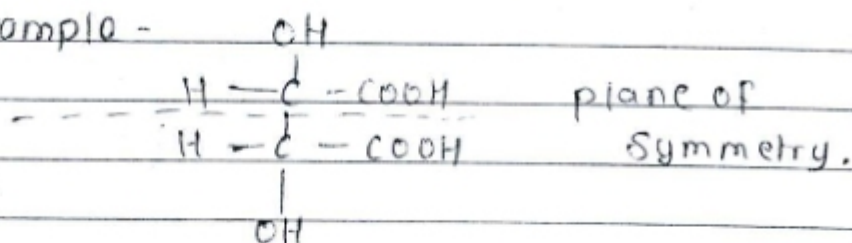

There are three elements of symmetry which helps in identifying superimposability of a molecule.

- a) Plane of symmetry
- b) Axis of symmetry
- c) center of symmetry.

a) Plane of symmetry :

It is an imaginary plane passing through the molecule which divides two equal parts so that half is the mirror image of each other.

For example -

Hence,

compounds having plane of symmetry are optically inactive.

b) centre of symmetry :

It is defined as the imaginary point in molecule through which when lines are drawn on side and produced potentially same group or point on either side.

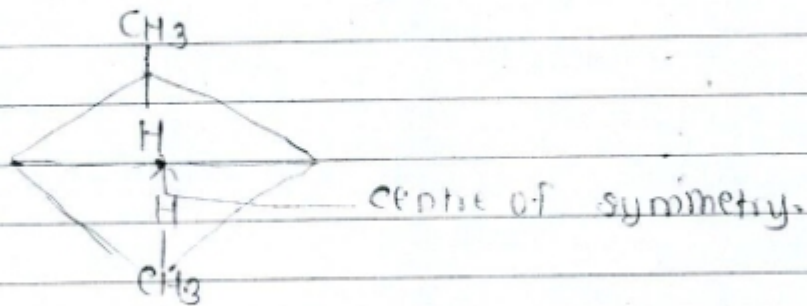

- The ... of molecule meet identical

atoms of equal distance from centre.

for example -

c) Axis of symmetry :

It is defined as an imaginary axis through which a molecule is rotated to an angle of  $360^\circ$ . It will give a molecule which is exactly similar to original molecule.

## Opent Book Test - 2

- 1) Write a note on stereoselective and stereospecific reaction with suitable example.
- 2) Explain E and Z nomenclature of geometrical isomerism.

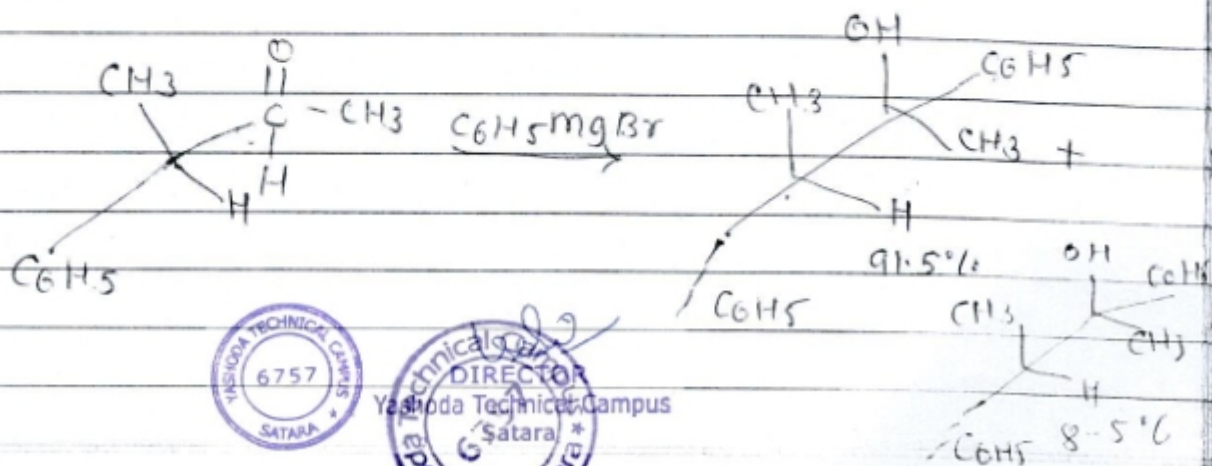

1) - Stereoselective is reaction where one stereoisomer of a product is formed over the another.

- The enantiomer of a chiral product are formed in unequal amount it is called as an enantioselective reaction.

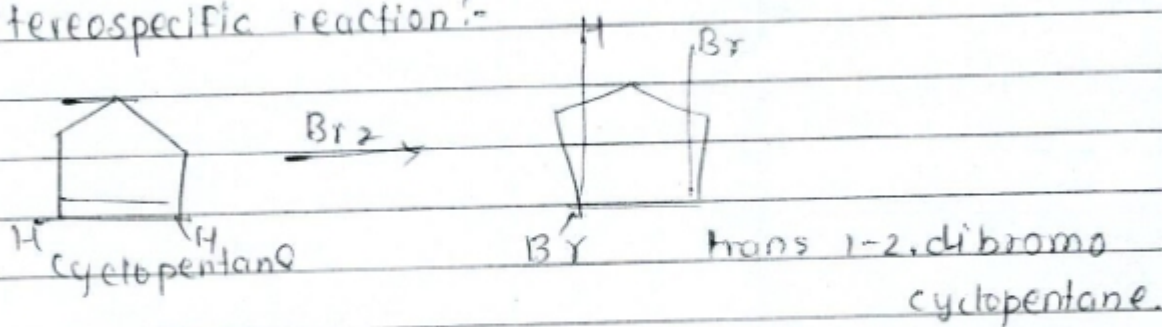

- Similarly when diastereomers are produced in unequal amount the reaction is called diastereoselective reaction.

Diastereomer selective.

### Stereospecific reaction:-

- Stereospecific reaction is a reaction where the stereochemistry of the starting material governs the stereochemistry of the product.
- only the single stereoisomer is produced in a given reaction rather than a mixture.

### 2) The E and Z system of nomenclature.

- The simple convenient of denoting the geometrical isomerism cis-trans is not possible when there are two different substituent are on double bond. Hence new system of nomenclature known as E and Z notation method is to be adopted.
- The configuration of any C=C can be specified using a set of priority rule devised in 1964 by Cahn, Ingold and prelog which is depend on following rules.

#### Rule - I :-

Priority is based on atomic numbers.  
Higher the atomic number higher is the priority.

*[Signature]*  
DIRECTOR  
Yashoda Technical Campus  
Satara

Rule - II :-

For isotopes higher the atomic mass higher is the priority.

Rule III :-

If the priority cannot be assigned on the basis of both atomic number and atomic mass then considering the first atom of the group.

- Then look at new set of atoms and single bond i.e atoms of double and triple bond is replicated.

Rule IV :-

In case of double and triple bond atoms participating in double and triple bond are considered to be an equivalent number of similar atoms by single bond i.e atoms of double and triple bond is replicated.

To use E and Z system first assigned priority to the two atoms or groups of atoms on one carbon of the double bond and repeat the process for the two atoms or group of atoms on other carbon.

- If the groups of higher priority are on same side of double bond the alkyl is designated which is derived from German word Zusammen means together.

- If the groups of higher priority are on opposite side of double bond the alkyl is designated as E which is derived from German word Entegen means opposite.
